28th March 2014

Attending: ajc, simon, kem, chris, lynne, srini, cathy
1. Opsim is now in stash what testing do we need before moving other repos (what training is needed)

- Walked through stash usage and access to the system
- Walked through pull requests
- Questions: what if there are no reviewers, can we have default reviewers (can they be reassigned)
- Use MAF as a guinea pig (done and access available to everyone)
- Repo branch: how many people should review, can I self review, how much burden on the reviewers this is all possible and configurable for each repo
- Chris suggests pull and rebase for branches (see introduction to git). clone, create branch, do work, pull --rebase (rewrites history so my changes are on top of previous changes), commit and push so history is sequential,
- Question: where to put personal repos (as a project under top level of stash)?
- see git tutorial for an intro to git

2. Defining groups and user access

- readonly access without login
- read/write access for jira-users at project level
- Permissions for read/write can be done at the repo level

3. Branching models. Please take a look at to see if we want to implement something like this or for a more ticket based system

- https://confluence.atlassian.com/display/STASH/Using+branches+in+Stash
- We can create a branch using git command line as opposed to using stash as long as you push back to remote
