

SuperTask requirements update 2018-01

IN PREPARATION

As part of preparing [LDM-556 \(Middleware Requirements\)](#) for release, we have observed some issues in the SuperTask requirements.

- 1. There are order-dependent text references (e.g., "see below") arising from the original draft on the [SuperTask design requirements](#) page, which are incomprehensible in the MagicDraw docgen output and are not appropriate for formal requirements.
- 2. There are some under-specified areas, e.g., provenance recording, where the above internal references didn't even have proper targets in their original form.

This page will capture suggested edits to the requirements in MagicDraw to resolve these issues.

Requirement IDs mentioned below in the form "-0000" should be understood to have the prefix "DMS-MWST-REQ".
